confusing laboratory results, and those with chronic pain syndromes, are identified. Dr Hunter's book is rich with case examples, rules of thumb, and strategies for addressing the problems these patients have. Every family physician will recognize the patients described in the book and will learn simple ways of dealing with their complaints and avoiding the common pitfalls of overreferral and overinvestigation.

Despite its strengths, this book is probably not for the hard-core, evidence-based psychiatry crowd. Evidence, although presented in some detail in the section on medication, is mostly anecdotal. At times the author uses terminology (eg, "ego states," "switching") and offers therapeutic strategies without adequate definition or background information. For inadequately trained physicians, applying some of the simple maneuvers suggested could be detrimental. At times the book lacks focus, with long stories about patients that sometimes lead readers to lose focus as well.

The first four chapters of the book set the framework for identifying these patients, and the rest the book includes chapters on medication, pain, the emergency department, and posttraumatic stress disorder. We recommend this book to physicians who want to better understand their patients with dissociative disorders.
